Note: The dependent variables are the standardized scores for locus of control, openness, conscientiousness, extraversion, agreeableness and neuroticism of individuals of age ten and eleven. Details about the measurement and construction of the scores are provided in section 3. The main explanatory variables "Involvement_m" and "Involvement_f" are indices constructed using factor analysis on 13 involvement proxies. These proxies are not self-reports from the Pre-Teen sample, but from older siblings who filled the youth questionnaire. More information in section 3. Robust standard errors in parentheses. * significant at 10%, ** significant at 5%, *** significant at 1%.
